Principle of Nano-chip Introduction

Nano-crystalline using monocrystalline silicon production, monocrystalline silicon features in addition to tough and can also be thin enough and short enough just to open the epidermis absorption barrier layer, far from touching the blood vessels and nerves, so do not feel the pain, and will not bleed

Nanocrystal line 5 through the skin to open the absorption channel to promote the absorption of skin care products So the skin care products can be more absorbed by the skin when using the nanocrystal introduction So the skin care products can be more absorbed by the skin when importing with nano-crystal.

High-pressure Hydration for Molecular Atomization

Nanocrystals use nanoscale contacts that can be as fine as 250+ nanometers and as short as 0.1mm.

Opens the skin's stratum corneum without touching the dermis

Solve the problem of skin absorption, but also to achieve a painless and non-invasive

Scan. Diagnose. Personalize Every Facial

- ☑ Real-time, high-resolution facial scanning
- ☑ Detects oiliness & Hydration, pigmentation, pores, Inflammation, fine lines levels
- ☑ Advanced AI-driven skin condition analysis
- ☑ personalized, data-based HydraFacial treatments
- ☑ consultation with visible skin metrics
